Approval Services API

## Seamless airspace approvals within your product

GuardianUTM's 'Approval Services API' brings airspace authorisations and land approvals to your users – removing a barrier to scaling UAS operations and streamlining the planning process through a simple API integration.

Through implementing our Approval Services API your customers directly benefit from Altitude Angel's 'UTM Ready' campaign, successfully deployed in a growing number of airports and large landowners throughout the UK and now expanding into Europe. We are making it easy for airspace authorities and major landowners to say "Yes" to drone operations by removing manual processes and creating effective communications between zone manager and drone operator. You can find out more about 'UTM Ready' *here*.

Key features:

- **Simple:** Embed authorisations into your product through a single API

- **Flexible:** API design makes it simple and consistent to support airspace-specific requirements, such as custom data capture, documentation, automated payment of processing fees and multiple stakeholder decisions

- **Global reach:** Offer approvals across worldwide locations as we onboard new airspace authorities and landowners

How does it work?

1 Drone operator creates a plan in your product

2 GuardianUTM's authority broker service checks if approval required

3 If needed, GuardianUTM sends requirements to your product

4 Drone operator submits details and documents via your product

5 GuardianUTM handles payment if required

6 GuardianUTM provides real-time approval updates

Find out how one of our GuardianUTM CLOUD customers has benefited from the Approval Services API:
